

**SECTION 24. SUNLIGHT ..... 24-1**

## **SECTION 24. SUNLIGHT**

The only “structures” related with the proposed project are associated with modifications to the existing Orrington Substation, the poles and associated hardware, and the conductors. The steelwork that will support the new relays, switches, and capacitors at the substation have only minimal potential for shading. Considering the insignificant area taken up by the poles and conductors and their location in the middle of a cleared wide right-of-way (ROW), the potential for shading of adjacent structures is virtually non-existent. Therefore, the project will not block access to direct sunlight for any structures utilizing solar energy through active or passive systems.
